

Lab – Agent with CrewAI

You need to build an Agent with CrewAI. The Agent create a Python program for some data analysis, runs that program and returns the result.

For this he uses 2 Agents

- One for coding
- One for executing the generated code

Each agent uses a proper task

The agents uses 2 tools : one for reading a file (a csv file for the data analysis) and one for executing Python code.

Theses 2 tools are in the tools.py file

The data analysis should be done on the persons.csv file

The whole process starts with an inputs which are the file name and the task itself (for example : calculate the avg age of the persons in the file)
